

The task is to create a QR code reader application.
We will use this API for interpreting QR code image files -
<http://goqr.me/api/doc/read-qr-code/> . (Section 3.2)
Please create an a .Net Core or a .Net Framework Web API/Console project with an endpoint which takes a local file system file path, reads the file and sends the file to the API above.
The return of the endpoint would be text data encoded in the QR code. You can generate a test QR code image using the same API service.
Please make a GitHub repo for this and give us the URL.
